S-Line – Miniature Safety Edge System

Application

Safety edges are used to protect dangerous closing edges at automatic doors and gates, shutters, vehicle doors or in the machinery industry. Depending on the force and speed of the moving part a suitable rubber

profile has to be selected. Bircher Reglomat safety components are developed and certified to meet today's European Safety Standards.

Description

S-Line consists of various components that together build a safety edge system.

- ① Contact strip
- ② Rubber profiles
- ③ Aluminium rail
- ④ End pieces
- ⑤ Switching units
- ⑥ Tools and accessories

The contact strip is made with two conducting elements made of conductive silicon. They are placed with a defined distance. The strip can be terminated with different end pieces, depending on the application. Inserted into the rubber profile and connected to a switching unit, all components make the complete system.

The safety edges can easily and quickly be assembled by the user. This provides enormous flexibility with regard to the production of different types in various lengths.

Function

Vertical force onto the safety edge causes a contact of the conductive elements inside the contact strip. This results in a change of the resistance and the current, which can be analysed by the control unit. If assem-

bled correctly, the safety edges are water tight. It works properly even at damage, as long as the contact strip is not destroyed.

Assembly Process

1 Cut rubber profile and strip ENT-S to length

2 Place end pieces

3 Press

5 Click profile into aluminium-rail

4 Insert contact strip and seal profile
